

Cybersecurity Incident Report:

Network Traffic Analysis

The UDP protocol reveals that the packet was unable to reach port 53 of the DNS server

This is based on the results of the network analysis, which show that the ICMP echo reply returned the error message: 203.0.113.2

The port noted in the error message is used for the translation of domain names into IP addresses.

The most likely issue is that the DNS server has been overloaded with requests and therefore has ceased from listening on port 53.

Time incident occurred: 1:24PM, 32 seconds.

The IT team became aware of the incident when customers of clients sent complaints to say they had been unable to access the webpage and received the error message that the destination port was unreachable.

The event was reported to a supervisor while analysts used network protocol analysers to review server logs when requests to the DNS server were made and tracing the issue back to discover the source of the issue.
