

Incident report analysis

Instructions

As you continue through this course, you may use this template to record your findings after completing an activity or to take notes on what you've learned about a specific tool or concept. You can also use this chart as a way to practice applying the NIST framework to different situations you encounter.

Summary	An ICMP packet DoS attack was used to halt server operations
Identify	The server going down means customers cannot access the company's services and many employees will be incapable of continuing the tasks assigned to them, which could lead to financial and reputational losses
Protect	Implement a proxy server or configure firewalls to limit ICMP packet ingoings. Ensure proper training for peers on how to explain the issue to customers and affirm that operations will be back to normal soon.
Detect	Use an IDS/IPS and SIEM logs to determine when the incident happened and how it was allowed to happen.
Respond	Update the playbook with better procedures for future responses to such incidents to improve efficiency of responding to DoS attacks.
Recover	Restart the servers so business operations can return to normal
